

Laser Pain Treatment from Dr. Srinivasan Attains Higher Success Rates than Surgical Treatments

Based on the high success rate, using minimally invasive lasers as an effective pain relief treatment is a better option than surgery. Advanced Interventional Pain Center uses cutting edge principals to selectively target pain nerves. The idea is to use a laser that does not produce heat as a pain relief treatment instead of having surgery and taking medications. Several people have been tested at Advanced Interventional Pain Center to selectively target pain nerves. Patients who worked with this program alongside Dr. Srinivasan have had extraordinarily positive results.

The National and International average for having success after non-laser pain relief treatment is below fifty percent. The success rate after treatment at Advanced Interventional Pain Center is over ninety percent. This program is a success without the use of a single narcotic. This information is available at the website for Dr Srinivasan's office at www.inter-pain.com. Dr. Srinivasan has founded a winning team in the Beverly Hills area and has gained the attention of the majority of the market.

Dr. Srinivasan is the inventor of LILA technology. LILA stands for Low Intensity Laser Ablation. This is the world's first laser that produces no heat. By using his broad knowledge of medicine, he founded the Advanced Interventional Pain Center ten years ago. Dr. Srinivasan's clients include people with failed back surgery who are pain free after only three visits, chronic headache sufferers, and people with sports injuries and joint pain. All of these people would still be suffering and probably addicted to heavy pain medications if it wasn't for the miracle of Dr. Srinivasan's invention.

This technology selectively targets pain nerves using biophotonic ablation with a low intensity laser. After the procedure there is an immediate end to the pain and discomfort. The pain relief lasts for long periods of time and there are no adverse reactions from this procedure. Injured workers are predicted to experience the most effective results. The most amazing feature of this laser program is that by getting this procedure done you may be preventing future surgeries because of the advanced methods of diagnoses of rare diseases.

Every year people are going to the emergency room in record numbers due to negative symptoms resulting from taking pain killers. A good article circulating the internet which boldly attempts to tackle this epidemic is "The Danger of Pain Killers: A Special Report" published July 2014 by consumerreports.org. Even over the counter drugs like generic Tylenol are in the same category as Vicodin when accounting for the number of people rushed to hospitals in the country. Dr. Srinivasan may be beginning to save the lives of patients who felt hopeless and had given up on getting pain free.
